

Apica ServerMonitor™

Do you get the best
out of your web platform?

We all know that server side infrastructure impacts web performance. The challenge is to find out why and how.

Keep an eye on your server performance

Web performance is highly dependent on server hardware and software performance. Apica ServerMonitor™ will let you know exactly how and which of your server side components are putting a limit on your web performance.

Find out server performance at max load

Cloud based service which requires no installation, configuration or modification of your current hosting environment.

Proven with top Content Management Systems. Use preconfigured project templates for EPiServer, Polopoly, Sitecore and more.

Get the data to make good decisions

Drill down and analyze detailed server performance data and make well founded decisions on IT investments. Do you need to change the database, add new front-ends to your load balancing cluster or increase memory?

Apica ServerMonitor™ will give you the answer.

The ultimate tool to optimize your server investments

Everybody knows that server side infrastructure impacts web performance. The challenge is to find out why and how.

Apica ServerMonitor™ tells you how and exactly where your current server side configuration limits your end user web performance. Now you can stop guessing about server performance and make sound web platform investment decisions based on facts.

Apica ServerMonitor™ software as a service

The service is implemented from outside your environment and only light performance agents need to be installed on your system.

This is how it works

The Apica Agent collects event information from multiple sources such as the Windows Event Viewer, Network and Systems Management frameworks, SNMP, ARM APIs and the Application Management Modules themselves.

All the monitoring data is stored in one central location, with no need for importing or exporting. Data is presented as intuitive graphs, such as overlay and side-by-side layout, and display:

- When the server CPU's are at 100% use.
- Which server consumes the most memory.
- Server hard drive write and read times.

Part of the Apica WebExcellence™ suite

The Apica WebExcellence™ suite is a complete toolkit for Web Performance Management.

- Use Apica ServerMonitor™ with Apica LoadTest™ to find out your server performance at maximum load.
- Use Apica ServerMonitor™ with Apica WebPerformance™ in order to track server performance over time and see how it affects web performance.

Features snapshot

- Standard API and cloud-based service structure, which avoids dependence on machine specific agents and allows for faster deployment without version or compatibility issues.
- Highly modular design which allows for flexible deployment of core or application specific modules.
- The deployment process is simplified and accelerated through auto-discovery and auto-detection mechanisms.
- Alerting, trending and reporting data and interfaces can be ported to Microsoft Operations Manager (MOM) and other frameworks or accessed through Apica ServerMonitor™ directly.
- Application specific thresholds can be set to allow for predictive or manual root-cause analysis.
